

# PRODUCTION PORTFOLIO

## COMBINED PERFORMANCE REPORT

### LONG + SHORT Strategies

QGSi Trading Strategy - ATR Trailing Stop  
Report Generated: 2026-01-15 18:24:13

Table of Contents

Section	Description
Part I	LONG Strategy Performance Report
Part II	SHORT Strategy Performance Report
Part III	Comparative Data Exploration (To Be Added)
Appendix	FIFO Realistic Backtesting Methodology

# PART I: LONG STRATEGY PERFORMANCE

ATR Trailing Stop (Period: 30, Multiplier: 5.0, Max Bars: 20)

## Portfolio Configuration

Parameter	Value
Starting Capital	\$1,000,000.00
Max Concurrent Positions	10
Position Sizing	10% of Current Equity
Signal Priority	First-Come-First-Served (ATR Tiebreaker)
Data Period	2025-06-02 to 2025-12-30
Total Trading Days	147
Trade Log File	Production_Long_Trades.parquet
Equity Curve File	Production_Long_Equity.parquet

## Performance Summary

Metric	Value
Final Equity	\$1,465,042.14
Net Profit	\$465,042.14
Total Return	N/A
CAGR	N/A
Sharpe Ratio	N/A
Sortino Ratio	N/A
Calmar Ratio	N/A
Max Drawdown	N/A
Volatility (ann.)	N/A
Profit Factor (Daily)	N/A

Risk-Adjusted Performance & Return Distribution

Risk-Adjusted Metric	Value
Smart Sharpe	5.9508
Smart Sortino	9.0049
Prob. Sharpe Ratio	100.00%
Omega Ratio	4.0570
Recovery Factor	30.74
Ulcer Index	0.0048
Serenity Index	40,174.93

Return Distribution	Value
Expected Daily	0.2644%
Expected Monthly	5.51%
Best Day	2.48%
Worst Day	-1.05%
Best Month	7.34%
Worst Month	2.66%
Skewness	0.7912
Kurtosis	2.2608

Drawdown Analysis

Metric	Value
Max Drawdown	N/A
Avg. Drawdown	N/A
Longest DD Days	N/A
Avg. Drawdown Days	N/A

Top 5 Worst Drawdowns

Rank	Drawdown	Days	Started	Recovered
1	-1.52%	15	2025-07-21	2025-08-05
2	-1.49%	21	2025-10-03	2025-10-24
3	-1.04%	7	2025-08-29	2025-09-05
4	-0.84%	1	2025-12-01	2025-12-02
5	-0.71%	6	2025-07-11	2025-07-17

### Win/Loss Statistics & Risk Metrics

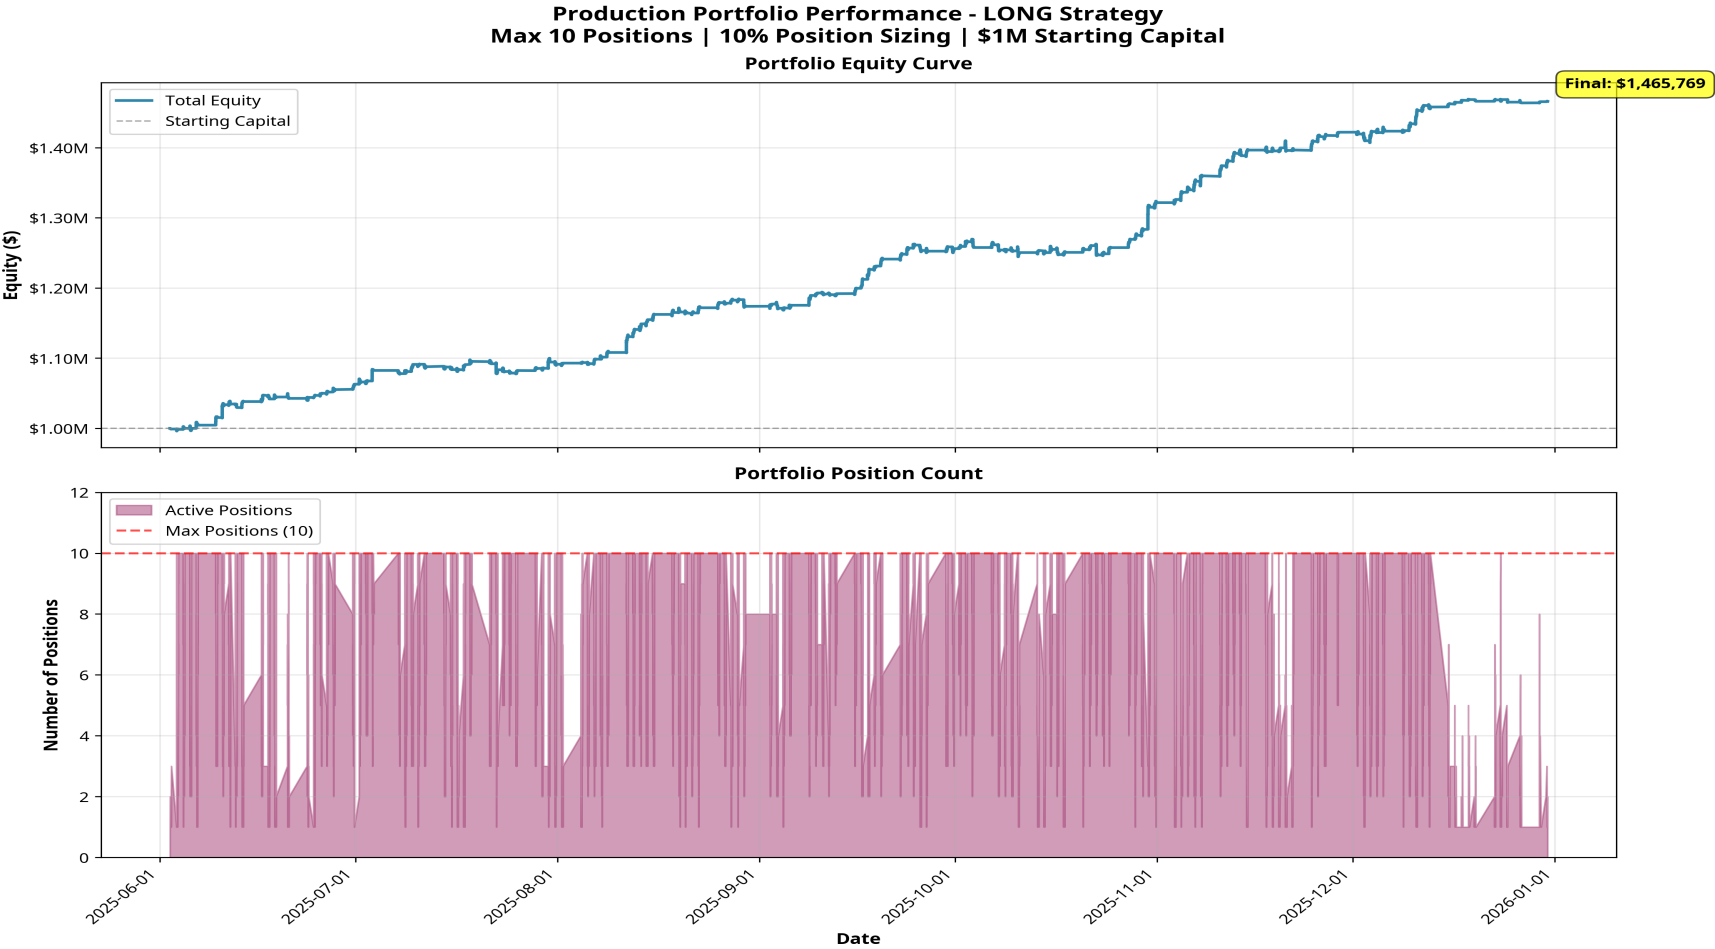

Win/Loss Metric	Value
Win Days %	49.76%
Win Month %	100.00%
Win Quarter %	100.00%
Payoff Ratio	1.5842
Gain/Pain Ratio	0.8585
CPC Index	4.6221
Tail Ratio	1.9041

Risk Metric	Value
Daily VaR	-0.5704%
Expected Shortfall	-0.7179%
Kelly Criterion	54.19%
Outlier Win Ratio	4.6255
Outlier Loss Ratio	0.0000

### Trade Statistics

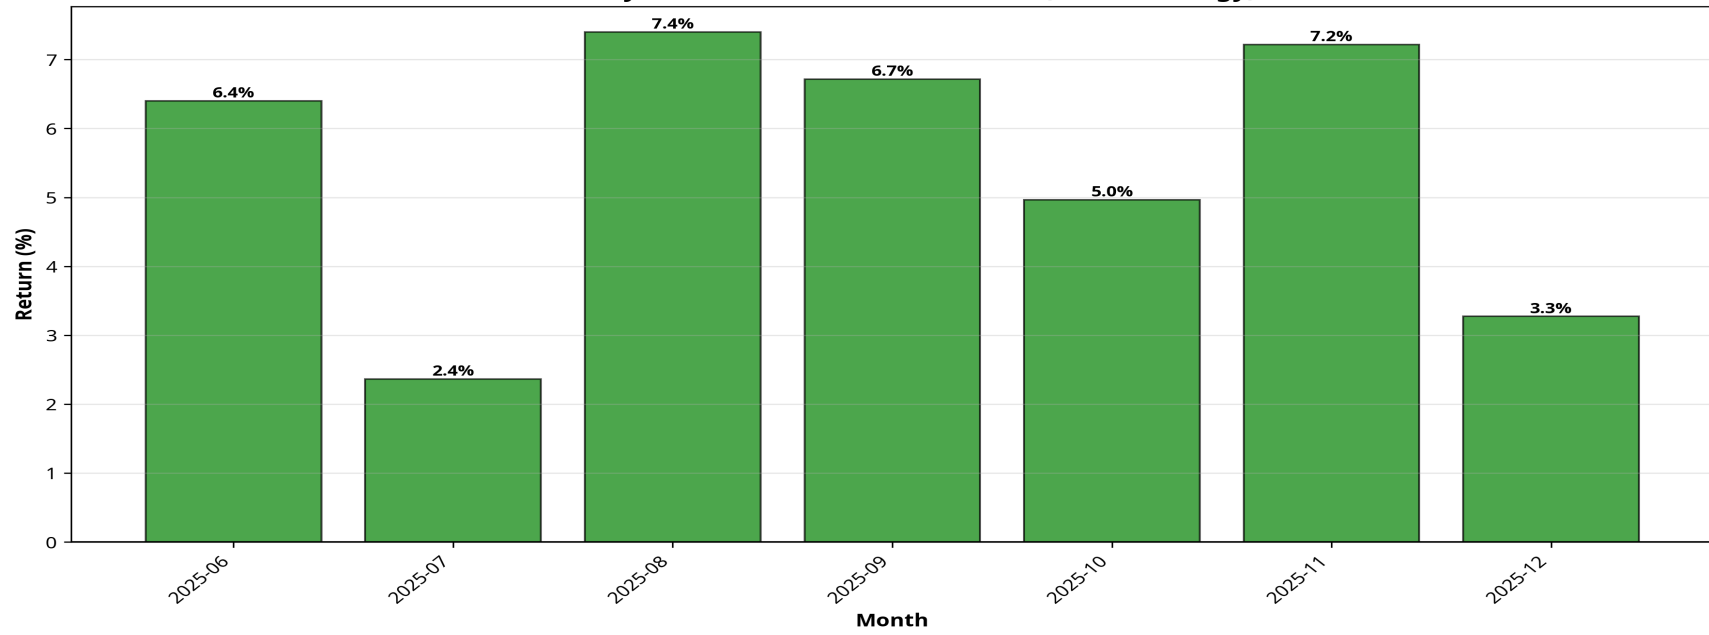

Metric	Value
Total Trades	N/A
Winning Trades	N/A
Losing Trades	N/A
Gross Profit	\$2,248,214.67
Gross Loss	\$1,783,172.54
Average Win	\$267.39
Average Loss	\$-217.94
Largest Win	\$22,896.78
Largest Loss	\$-12,000.99

LONG Strategy Equity Curve

LONG Strategy Monthly Returns

**Monthly Returns - Production Portfolio (LONG Strategy)**

## PART II: SHORT STRATEGY PERFORMANCE

ATR Trailing Stop (Period: 30, Multiplier: 1.5, Max Bars: 20)

### Portfolio Configuration

Parameter	Value
Starting Capital	\$1,000,000.00
Max Concurrent Positions	10
Position Sizing	10% of Current Equity
Signal Priority	First-Come-First-Served (ATR Tiebreaker)
Data Period	2025-06-02 to 2025-12-30
Total Trading Days	147
Trade Log File	Production_Short_Trades.parquet
Equity Curve File	Production_Short_Equity.parquet

### Performance Summary

Metric	Value
Final Equity	\$1,362,946.79
Net Profit	\$362,946.79
Total Return	N/A
CAGR	N/A
Sharpe Ratio	N/A
Sortino Ratio	N/A
Calmar Ratio	N/A
Max Drawdown	N/A
Volatility (ann.)	N/A
Profit Factor (Daily)	N/A

### Risk-Adjusted Performance & Return Distribution

Risk-Adjusted Metric	Value
Smart Sharpe	13.41
Smart Sortino	33.65
Prob. Sharpe Ratio	100.00%
Omega Ratio	15.68
Recovery Factor	138.14
Ulcer Index	0.0005
Serenity Index	2,531,036.47

Return Distribution	Value
Expected Daily	0.2126%
Expected Monthly	4.43%
Best Day	1.50%
Worst Day	-0.2306%
Best Month	6.06%
Worst Month	2.29%
Skewness	1.7738
Kurtosis	4.6326

### Drawdown Analysis

Metric	Value
Max Drawdown	N/A
Avg. Drawdown	N/A
Longest DD Days	N/A
Avg. Drawdown Days	N/A

### Top 5 Worst Drawdowns

Rank	Drawdown	Days	Started	Recovered
1	-0.26%	4	2025-08-21	2025-08-25
2	-0.24%	1	2025-10-15	2025-10-16
3	-0.23%	3	2025-12-19	2025-12-22
4	-0.19%	4	2025-07-11	2025-07-15
5	-0.18%	0	2025-06-06	2025-06-06

### Win/Loss Statistics & Risk Metrics

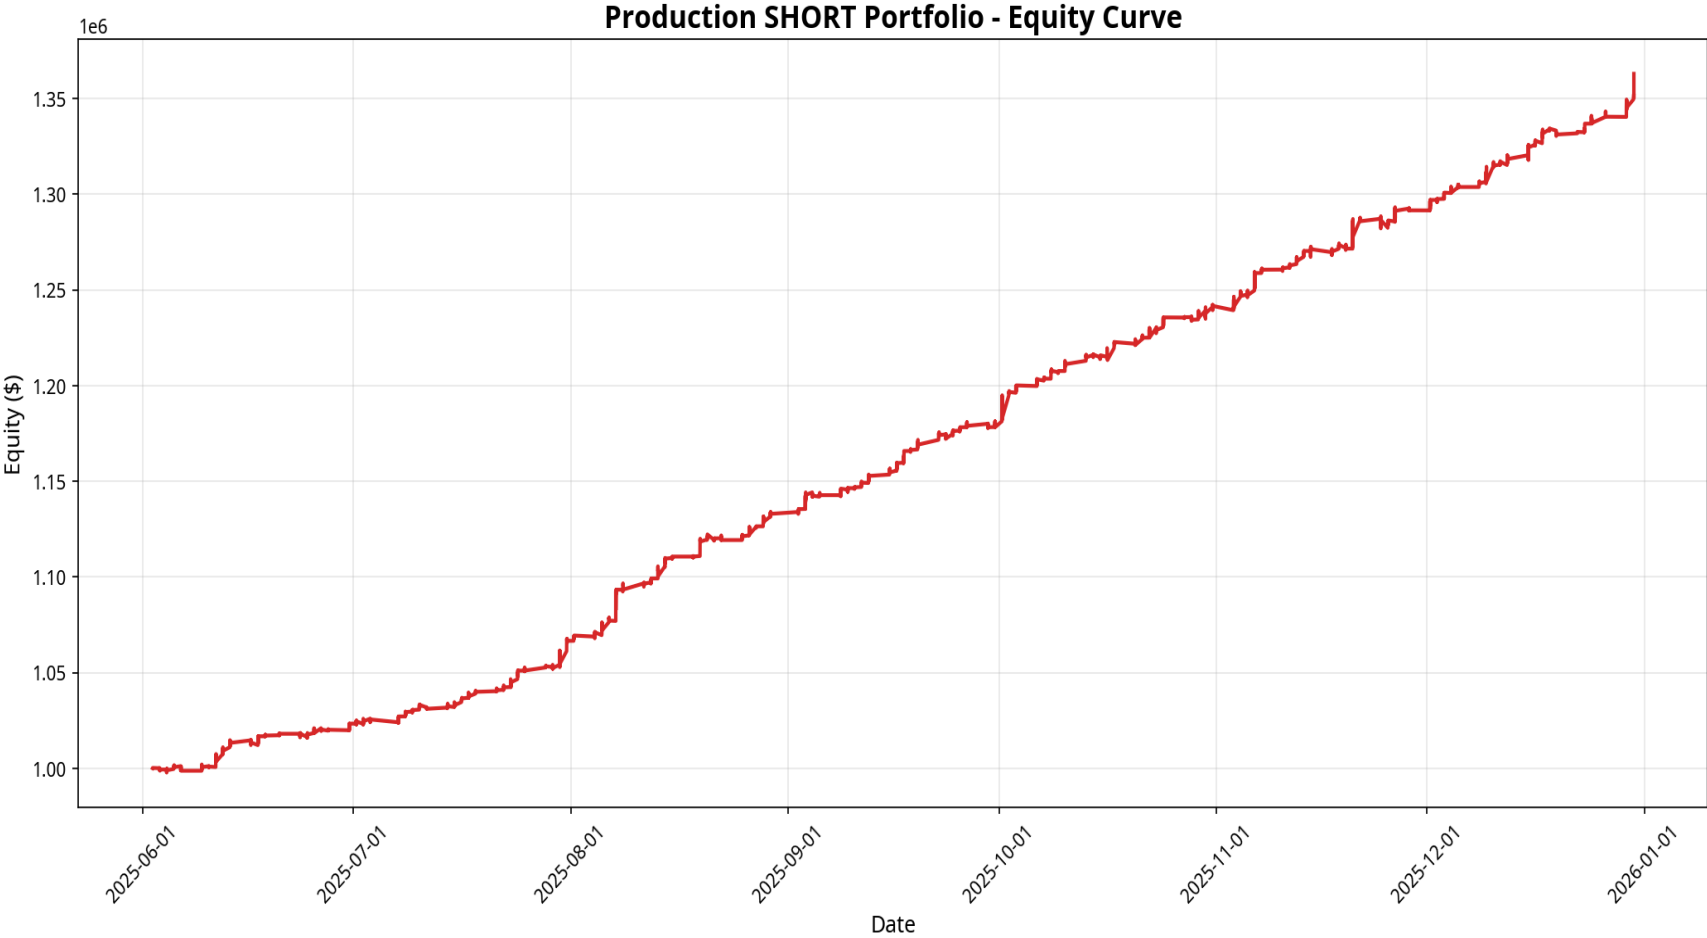

Win/Loss Metric	Value
Win Days %	57.35%
Win Month %	100.00%
Win Quarter %	100.00%
Payoff Ratio	3.2390
Gain/Pain Ratio	2.5132
CPC Index	42.08
Tail Ratio	7.5207

Risk Metric	Value
Daily VaR	-0.1007%
Expected Shortfall	-0.1748%
Kelly Criterion	77.59%
Outlier Win Ratio	4.6870
Outlier Loss Ratio	0.0000

### Trade Statistics

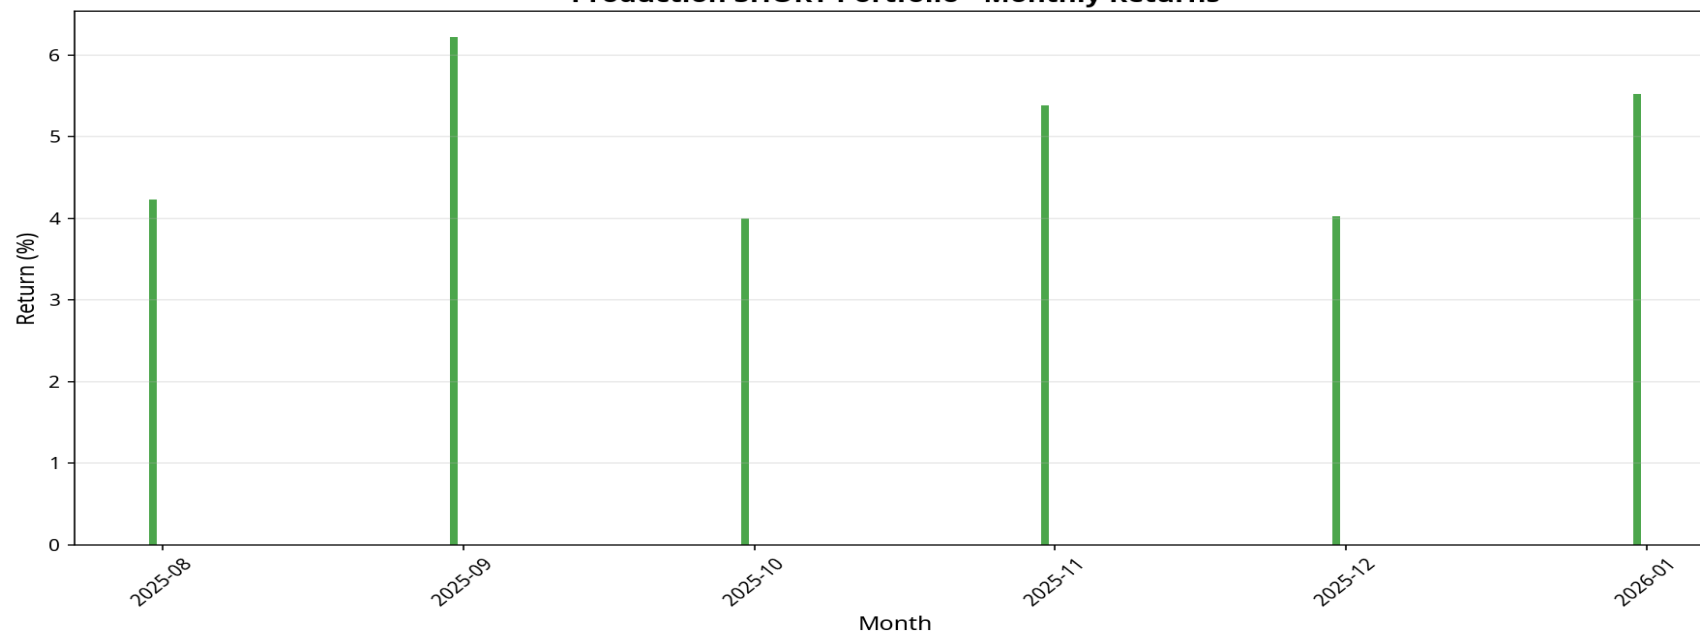

Metric	Value
Total Trades	N/A
Winning Trades	N/A
Losing Trades	N/A
Gross Profit	\$589,838.78
Gross Loss	\$226,891.99
Average Win	\$664.23
Average Loss	\$-424.10
Largest Win	\$9,372.45
Largest Loss	\$-2,320.14

SHORT Strategy Equity Curve

SHORT Strategy Monthly Returns

**Production SHORT Portfolio - Monthly Returns**

## PART III: COMPARATIVE DATA EXPLORATION

This section will contain comparative analysis of LONG and SHORT strategies, including:

- Side-by-side performance comparison
- Correlation analysis between strategies
- Combined portfolio simulation (LONG + SHORT)
- Trade distribution analysis
- Symbol overlap and timing analysis
- Risk-adjusted return comparison
- Drawdown period correlation
- Monthly performance comparison

**[TO BE ADDED BY USER]**

# APPENDIX: FIFO Realistic Backtesting Methodology

## Overview

This appendix documents the First-In-First-Out (FIFO) realistic backtesting process implemented to ensure the production portfolio simulator accurately replicates real-world fund performance. The methodology addresses critical challenges in portfolio-level backtesting that are often overlooked in traditional signal-level analysis.

## The Challenge

Traditional backtesting systems evaluate trading signals in isolation, assuming unlimited capital, no position limits, perfect execution, and instantaneous position entry. This creates a significant gap between theoretical signal performance and actual fund performance. A production trading fund faces concrete limitations: fixed capital (\$1M), position limits (max 10 concurrent), position sizing (10% of equity), signal competition, and execution sequencing.

## FIFO Methodology

The FIFO methodology ensures that trade sequencing, position management, and capital allocation exactly mirror how a live fund would operate. All entry and exit signals are processed in strict chronological order based on timestamp, ensuring earlier signals are evaluated first with no future information influencing past decisions. The simulator maintains real-time portfolio state tracking current open positions, available capital, position count, and equity curve at every timestamp.

## Key Constraints

When a new signal arrives, the simulator enforces: (1) Position limit check - if 10 positions are open, skip the signal; (2) Capital allocation - position size calculated dynamically as 10% of current equity, not starting capital; (3) Signal priority - when multiple signals occur simultaneously, priority determined by timestamp first, then ATR value (higher ATR = higher priority); (4) Exit processing - stops triggered immediately when price hits stop loss or maximum bars reached.

## Baseline vs Production - LONG

Baseline (theoretical) assumed every signal is taken with unlimited capital, resulting in 31,823 trades for LONG strategy. Production (realistic) applies real fund constraints with 10-position limit and 10% sizing, resulting in 16,754 trades (52.6% of signals). The remaining 15,069 signals (47.4%) were skipped due to max positions reached.

## Baseline vs Production - SHORT

Baseline (theoretical) assumed every signal is taken with unlimited capital, resulting in 60,111 trades for SHORT strategy. Production (realistic) applies real fund constraints with 10-position limit and 10% sizing, resulting in only 1,424 trades (2.4% of signals). The remaining 58,687 signals (97.6%) were skipped due to max positions reached. This demonstrates that SHORT signals are highly concentrated in time.

## Key Functions

process\_baseline\_to\_production() - Main orchestrator converting baseline trades to production trades. check\_position\_availability() - Determines if new position can be opened. calculate\_position\_size() - Computes shares based on current equity. update\_equity\_curve() - Records equity at each timestamp. process\_exits() - Checks all open positions for exit conditions. calculate\_performance\_metrics() - Computes comprehensive performance statistics including Sharpe, Sortino, drawdown, win rate, and profit factor.

## Validation

The system ensures: (1) No look-ahead bias - all decisions use only information available at the time; (2) Capital conservation - total deployed capital never exceeds available equity; (3) Position integrity - no duplicate symbols, all exits matched to entries, PnL verified; (4) Equity curve continuity - continuous with no gaps, every trade impact recorded, drawdowns measured from running peak.

## Conclusion

The FIFO realistic backtesting methodology transforms theoretical signal performance into achievable fund performance by enforcing real-world constraints, respecting temporal sequencing, simulating actual portfolio management, and eliminating look-ahead bias. This approach provides institutional-grade backtesting that accurately represents what a live trading fund would experience.
